INTRODUCTION

This is the second edition of the International Rhododendron Register to be published by the Royal Horticultural Society in its role as International Cultivar Registration Authority (ICRA) for the genus *Rhododendron*. The first edition, published in 1958, came just three years after the Society's initial appointment as ICRA by the International Society for Horticultural Science. Since then 40 Supplements have been produced by the Society. These were initially (1961-1986) included as an integral part of the *RHS Rhododendron and Camellia Year Book* but from 1987 onwards have been produced as independent publications.

Work on this second edition began in 1983. Initially the intention was merely to integrate all the published registration lists. However it soon became evident that a more extensive revision of the earlier entries would be required to bring nomenclature up-to-date, to make the format of entries consistent and to incorporate new data for many entries. Furthermore a considerable number of additional, unregistered uses of names had come to light and it was decided to include these as part of a new Checklist function for the work, integrated with the Register itself. This has now been done. Whilst this Register and Checklist is thus demonstrably a more comprehensive guide than its predecessor it must be acknowledged that coverage, both of past and present usage is still now not complete and the Society would welcome the receipt of any new, revised or supplementary material. This Register and Checklist comprises over 28,000 entries for cultivar and Group epithets (including their synonyms) as well as the names of nearly 2000 individuals or firms that have played a role in the raising, naming, introduction or registration of these plants.

Scope of the Register and Checklist

This Register and Checklist incorporates a record of all epithets known to have been used for cultivars or Groups within the genus *Rhododendron* up to the end of December 2002. It thus covers all azaleas, azaleodendrons and vireya rhododendrons as well as what might be thought of as the 'core' of hardy rhododendrons. All epithets published in the 1958 Register as well as in the forty published Supplements are included, together with a very large number of additional uses of epithets that have come to light in the course of ongoing research. Neither common names, nor the botanical epithets of species are included as individual entries. Nor are trademarks included as such. On occasions a cultivar or Group epithet is included which is based on a published botanical epithet, but its appearance in the Register and Checklist indicates that, at some time at least, the entity it represents has been treated as a cultivar or Group.

Duplicated uses of epithets are each treated individually wherever they are known to have occurred. Whilst the registration system exists to try and prevent such duplications (and it has certainly helped to reduce their occurrence) no such voluntary scheme can hope to eradicate the practice of reuse entirely – and there is an historical reservoir of duplicated usages especially from the time in the nineteenth century when *Azalea* was treated as a separate genus. It will be of value to *Rhododendron* enthusiasts to have such multiple usages highlighted with as much information as possible provided to distinguish one usage from another. An element of judgement has had to be exercised in whether to interpret many early usages as duplications based on separate entities or merely the same plant described or referred to in a different way.

Nomenclature

Botanical nomenclature and classification followed in reporting on parentage and origin of the cultivars and Groups in this listing follows the *Rhododendron Handbook 1998* (RHS, 1997). This is based on the revision of the genus pioneered by David Chamberlain and James Cullen and published by the Royal Botanic Garden, Edinburgh during the last quarter of the 20th century. This revision, controversial in its time, now seems to have been widely accepted as the basis of most modern accounts of the genus, both in the wild and in cultivation.

The Register and Checklist deviates from the Edinburgh revision in only one significant case: the treatment of the uniquely popular and influential species *R. yakushimanum*. In the 1998 *Handbook* this taxon is treated as a subspecies of *R. degronianum* whereas for convenience and the sake of familiarity and brevity in the Register and Checklist it is retained as a species.

The use and spelling of botanical epithets follows the rules and recommendations of the *International Code of Botanical Nomenclature* (ICBN) (IAPT, 2000). The use of Latin-form cultivar and Group epithets and the use and formation of cultivar and Group epithets in languages other than Latin follow as far as possible the *International Code of Nomenclature for Cultivated Plants* – 1995 (ICNCP) (Quarterjack Publishing, 1995). (Note: the text of this Register & Checklist was completed prior to the publication of the subsequent (2004) edition of the Code. Some of the changes that would now be required as a result are noted in the relevant parts of this Introduction.)

Grex epithets

Following what has become general practice, the entries in the 1958 Register for grex epithets have here been treated as representing Groups. The term grex is now restricted for use in orchids alone.

Synonyms
In this Register and Checklist the word synonym (abbreviated as "syn.") has been used to represent a very broad concept and incorporates any epithet (or variant of an epithet) which is not the currently accepted one for that cultivar or Group. Thus later names for the same cultivar, misspellings, translations etc. may all be treated as synonyms. The development of a distinction between synonyms and trade designations as now set out in the latest *International Code of Nomenclature for Cultivated Plants* (ISHS, 2004) came too late to be systemically incorporated here.

Ordering of Entries
The Register and Checklist is presented in one integrated alphabetical listing. This strict alphabetical ordering initially ignores casing, accents, spaces or punctuation marks e.g. 'A.B. Mitford' lists after 'Abessa'. When epithets differ only in whether the epithet is rendered as one, two or more words, the version with a multiple word epithet is listed first e.g. 'Appleblossom' lists after 'Apple Blossom'.

When the same epithet has been used more than once their individual order is determined by the broad category to which the plant belongs so that they appear in the following order:

(a) = azalea
(r) = rhododendron (excluding azaleas, azaleodendrons and vireyas)
(v) = vireya rhododendron
(az) = azaleodendron

Should this still leave duplicated entries the epithets are listed in date order.

Where a cultivar belongs to a Group and both share the same epithet then the two entries are printed together (the ordering process in this case ignoring the word Group).

Gender of epithets
When *Azalea* was recognised as a genus separate from *Rhododendron* latin form cultivar epithets of azaleas had to agree with feminine gender of *Azalea*. When the two are united under the neuter genus *Rhododendron* such latin form epithets have to change to reflect this. Thus in this Register and Checklist azalea cultivars originally published as 'Alba' and 'Iveryana' will now be found listed as 'Album' and 'Iveryanum'. This can sometimes make a significant difference to their position in the alphabetical listing and should be borne in mind if an epithet appears at first to be missing from the Register and Checklist.

Transliteration of Japanese Epithets
It has not yet been possible to undertake a thorough and consistent revision of the transliterated versions of Japanese epithets to bring them into line with the ICNCP. The Code requires adherence to a modified Hepburn system of transliteration and to ensure accuracy in this regard the original Japanese characters need to be available. The rendition of many such epithets in the Register and Checklist must therefore be regarded as provisional until further work can be done. In general they have been reproduced here as found in the literature with some limited attempt to eradicate apparent inconsistencies in their format and spelling. (Note: the 2004 Code now treats the rendition of a nonalphabetic script into an alphabetic script as transcription, not transliteration.)

Interpretation of Individual Entries
Information on each entry in the Register and Checklist is presented in a consistent style, format and order. It may consist of all or some of the following:

(a) Category of plant. Each entry starts with an indication of a broad category to which that plant belongs i.e. azalea (a), azaleodendron (az), rhododendron (r) or vireya (v). The category rhododendron in this context refers to any plant that does not fall into any of the other three.

(b) Epithet. The cultivar or Group epithet is given in bold typeface. In nearly all cases words are spelt out in full and not abbreviated (even where such abbreviations are permitted). e.g. Doctor not Dr, Professor not Prof. The expanded form of an abbreviation may depend on the language in which the epithet was first established.

(c) Status. An indication of status is given using the following abbreviations:

cv. = cultivar
gp = Group

All cultivar epithets are distinguished by being placed within single quotes. Entries in the 1958 Register which are designated as grex epithets are here treated as Groups.

(d) Subcategories. An indication is given of whether the plant concerned belongs to one of the following subcategories:-

Evergreen azalea
Deciduous azalea
Semi-evergreen azalea
Lepidote rhododendron
Elepidote rhododendron
Azaleodendron
Elepidote/Lepidote cross

(e) Parentage. When the direction of parentage is known the seed parent is given first and indicated by (s). The two parents are separated by a large multiplication sign (×). When an individual parent consists of a hybrid formula (i.e. it is not an individually named cultivar or Group) its parental elements are given separated by a small multiplication sign (×) e.g. 'Rosa Belton' × *oldhamii* (s) × *prinophyllum* in which the direction of the cross is known but the seed parent is an unnamed derivative of 'Rosa Belton' × *oldhamii*.

It is likely that most hybrids listed with *R. lochiae* as a parent are in fact hybrids of *R. viriosum*, the latter being the prevalent plant in cultivation before the two were distinguished.

In many cases where both a Group and a cultivar derived from it bear the same epithet it has been impossible to say with certainty in which sense the epithet has been used when given as part of a parentage. In such cases the Register and Checklist errs on the side of caution in treating them all as representing the Group. It is likely, but by no means always the case, that where there is an awarded cultivar from the Group which bears the same epithet, it is that award cultivar which has been used in producing further hybrids.

Reference is sometimes made under parentage – and elsewhere – to collectors' numbers, the distinctive set of initials and numbers used by collectors to distinguish individual accessions of seeds or plants made in the wild (e.g. L&S114, a Frank Ludlow and George Sherriff collection made on their 1934 expedition to Bhutan & SE Tibet). Details of such collections are to be found in *The Rhododendron Handbook 1998* (RHS, 1997).

(f) Roles. A record is given of the names of those concerned in the various roles involved in the development and recording of each plant. These are distinguished by the following letters (given in the order in which they are cited in the text).

R = raised by … (used in many earlier records and generally assumed to include what would now be distinguished as H & G.)

H = hybridised by … (when a plant is indicated to be the result of an open-pollination the role letter "H" is still employed and in such cases it should be understood that the cross took place whilst the plant was in the possession of the individual or firm named, who will also have collected the seed.)

G = grown to first flower by …

S = selected by …

N = named by …

I = introduced by …

INC = incorporated into records at the time of publication of the first Register (1958). Any name known to have been in use prior to 1958 is treated in this way irrespective of whether it was actually listed in the 1958 Register.

REG = registered by …

In some cases the only information available is that the plant was listed by a particular nursery or another source. Such cases are given as "L" = listed by … (the source will either be given in the list of names and addresses on pp1492–1543 or in the bibliography on p.1544).

As was the custom in the past many plants raised on large estates are credited to the owner of that estate. It should be recognised however that in many of these situations there would have been an influential (head) gardener who did much (or all) of the work concerned. Today such individuals would get the direct credit they deserve. Wherever possible in this Register & Checklist mention is made in the list of names and addresses at the back of the Register of the key gardeners involved.

(g) Description. The descriptions vary widely in length depending on the information that is available. Plants which have been registered recently may often have lengthy accounts and this detail can be of considerable value in determining identity and distinctness. On the other hand for some early cultivars no descriptive data may be available.

On occasions where sources differ in descriptive detail, or where the origin of the information is other than from the raiser, the sources may be given in parenthesis.

(i) Measurements All measurements are in metric units and where combined length/breadth measurements of parts of a plant are given length is always given first e.g. Fls 55 × 60mm indicates that the individual flowers are 55mm long and 60mm broad. Overall plant height/width is given with height before width e.g. Shrub 1.5 × 2.0m indicates a plant 1.5m tall and 2.0m wide.

Corolla length should be the length from the base of the tube to the tip of the longest lobe measured along the flattened surface of the corolla.

(ii) Colour When no Colour Chart was employed colour names follow those used by the registrant or other source.

References to three Colour Charts will be found within the text and can be identified by the distinctive format of the colour references as follows:

RHS ColourChart (1966, 1986, 1995 & 2001)
e.g. 187B
Horticultural Colour Chart (1942)
e.g. 403/3
Nickerson Colour Fan (1957)
e.g. 2.5RP 9/5

When it has been possible to do so consistently within an entry colours formerly listed using the HCC have been converted to those of the RHS Colour Chart, using the Table of Cross-References provided with the 1966 edition. Colour names for references to the RHS Colour Chart are those employed by R.D. Huse & K.L. Kelly in *A contribution toward standardization of color names* (ed. D.H. Voss and published by the American Rhododendron Society in 1984). Although every effort was made to ensure that the relevant colours in the four editions of the RHS Colour Chart matched each other some discrepancies have been noted. If required the ICRA can sometimes supply details of the edition used in an individual entry should this be of critical importance.

(iii) Flowering time will usually be as given by the registrant and relates to the place of origin. Times relate to the Northern Hemisphere unless indicated to the contrary.

(h) Awards. Awards made to rhododendron and azalea cultivars by the Royal Horticultural Society are included in the Register and Checklist. The following abbreviations are used:

FCC = First Class Certificate
AM = Award of Merit
SCC = Second Class Certificate (discontinued)
PC = Certificate of Preliminary Commendation
HC = Highly Commended (discontinued)
C = Commended (discontinued)
* = award made after Trial

The Society also gives an Award of Garden Merit – AGM – for plants of 'outstanding excellence for ordinary garden decoration or use'. The award was re-instituted in 1992 at which time all previous AGMs were rescinded. The award is now subject to regular review at which times names may be added to or deleted from the list. These awards are not given here but updated lists may be found in a regularly published AGM listing by the Society and on its website.

(i) Synonyms. Synonyms are given after any awards and are cross-referenced. Also included here are any relevant breeders' codes or other references which may have gained some more general use before the plant was named: although there are exceptions these are not generally to be treated as epithets.

(j) Informal Groupings. In the 1958 Register most azalea cultivars were allocated to informal groupings based on their parentage, raiser or a combination of the two. These have been repeated in the relevant entries in this Register and Checklist, but no systematic attempt has been made to allocate later entries to these groupings or to recognise new ones. These groupings and many more can be found listed in F.C. Galle's *Azaleas* (1987), where their origin and characteristics are described. Those employed in this Register and Checklist for azaleas include:

Deciduous azaleas

Ghent	Occidentale
Knap Hill (including Exbury)	Rustica
Mollis	

Evergreen azaleas

Amoena	Kurume
Arendsii	Oldhamii
Back Acres	Pericat
Bobbink & Atkins	Rutherford
Coolidge	Sander
Gable	Satsuki
Glenn Dale	Vuykiana
Indian	Wada
Kaempferi	

Tsutsuji is recorded from Ito (1692) as a grouping for azaleas other than Satsuki.

One informal grouping of rhododendrons is used: the Hardy Hybrids, being a popular designation for a range of very hardy, floriferous plants tolerant of exposure and sun and found in a wide range of colouring.

None of the informal groupings mentioned above are treated here as Groups under the terms of the *International Code of Nomenclature for Cultivated Plants.*

(k) Parenthesised notes. An entry may finish with various relevant entries within a parenthesised note. These may include references to:

(i) The original place of publication where the name was first established
(ii) The nature and location of any Standard specimen. (Note: Now, under the 2004 Code, to be styled as a nomenclatural standard.)
(iv) Further details on origin
(v) The name of the formal Group to which a cultivar belongs
(v) Other relevant comments

Cross references from a synonym entry to the accepted name are also listed in these notes.

Acknowledgements

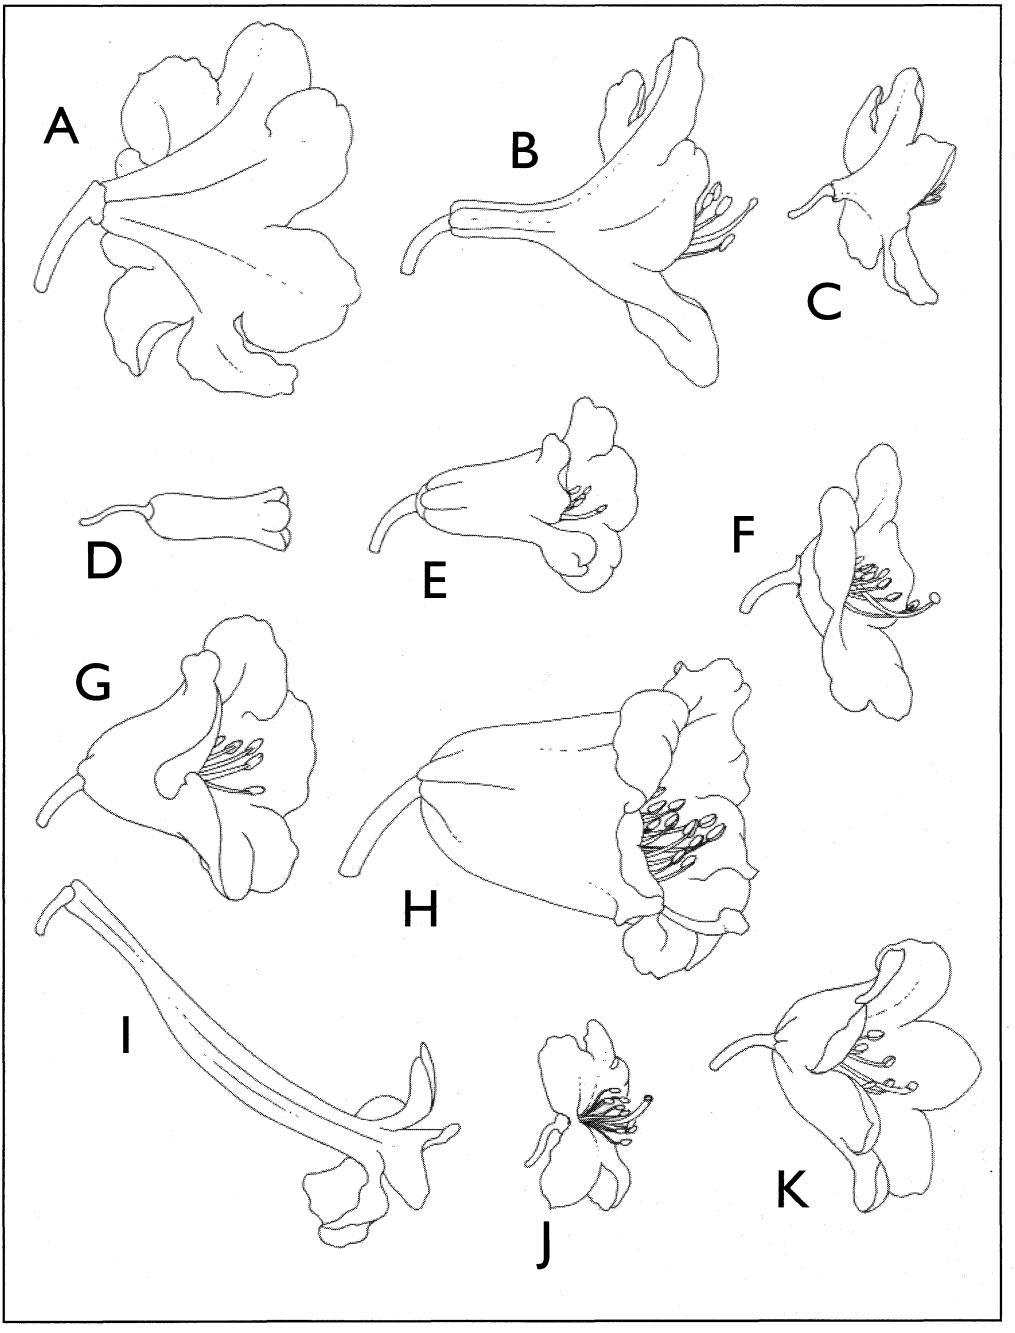
In the course of preparation of this Register and Checklist the Society has received much help and advice from a great many individuals. To all those concerned the Society is immensely grateful.

Although it may seem invidious to mention some individuals by name the International Registrar would like, in particular, to pay special tribute to a small international team of volunteers who have read the text as it was produced and not only corrected many errors and inconsistencies, but contributed significant data to augment existing entries and to add new ones. This team consisted of the late John Bond (UK), Michael Cullinane (New Zealand), Albert De Raedt (Belgium), Graeme Eaton (Australia), the late Alan Hardy (UK), Jay Murray (USA), Charles Puddle (UK), Walter Schmalscheidt (Germany) and Yukio Sasaki (Japan). Chris Callard (UK) has also been generous in supplying data on many vireya cultivars. Their contribution has been of major significance to the success of this Register & Checklist and their patience in awaiting the final outcome has been much appreciated. It should however be clearly understood that any remaining errors, omissions or inconsistencies are the responsibility of the International Registrar.

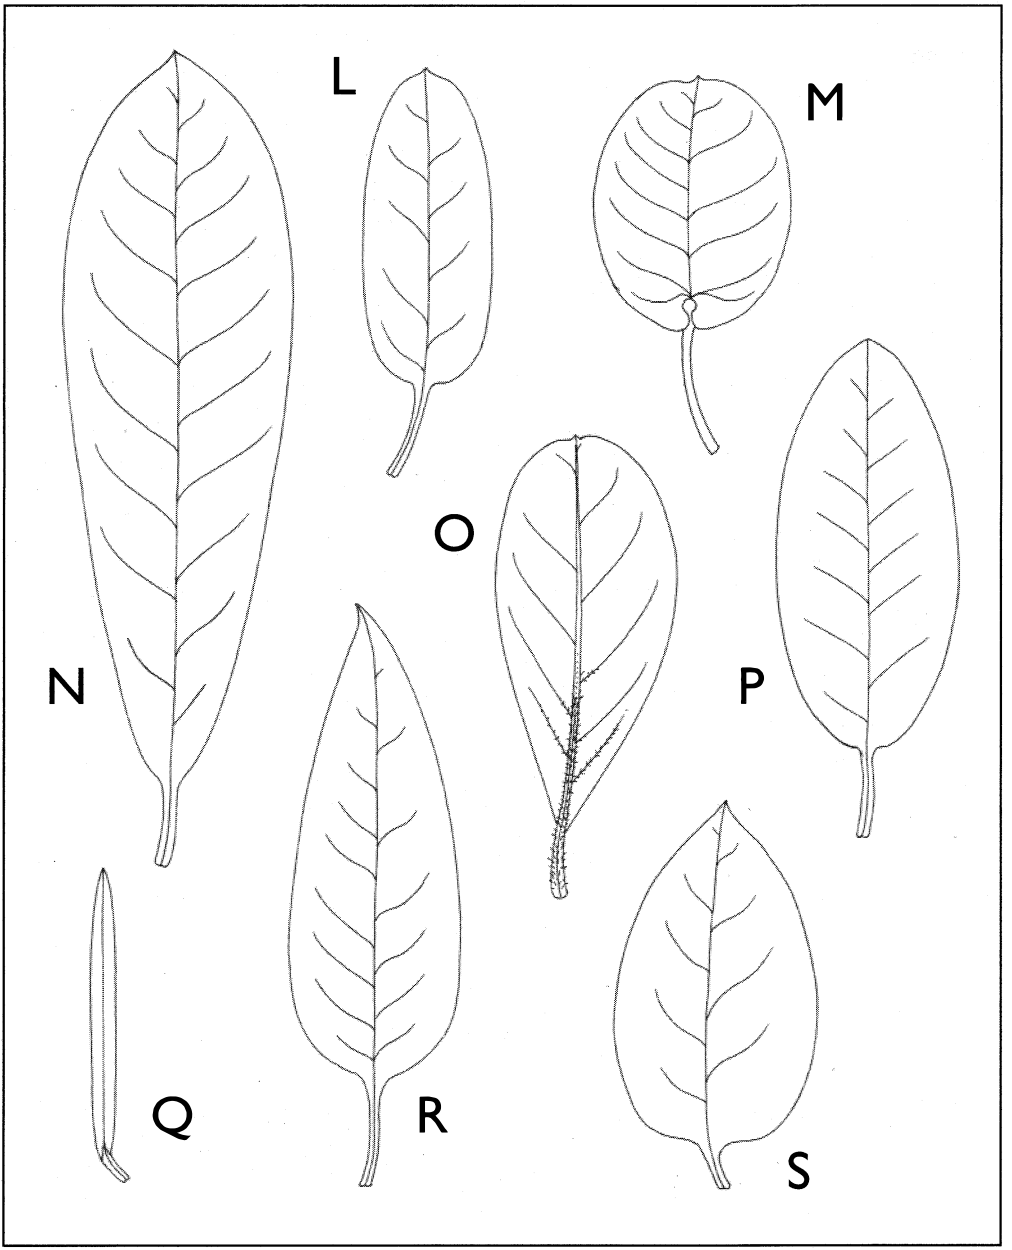
A special note of thanks is also due to Judy Restall who over a period of many years has transferred the huge volume of data from over 28,000 index cards into electronic format. Her efficient and painstaking work has made the job easier for the rest of us. Robert Hacker has also provided exemplary IT support throughout the project and devised the Access program on which the Register is currently held.

GLOSSARY

ACUMINATE tapering very gradually to a point
ACUTE coming to a point that would be contained within two lines set at 90°
ANEMONE-CENTRED of a double flower with numerous petaloid segments in the centre
ANTHER the pollen-bearing part of the stamen, borne at the end of the stalk-like filament
APICULATE terminating in a small, abrupt point (the point formed only from the vein or midrib)
APPRESSED lying flat
ARISTATE extended into a long bristle
ATTENUATE narrowing gradually
AURICULATE with small, ear-like projections at the base of the leaf
AXILLARY growing from the angle formed by the junction of leaf and stem
BLOOM waxy covering
BLOTCH a defined area of often contrasting colour; may be solid, spotted or a mixture of the two
BULLATE with a blistered or puckered surface
CALYX the outermost whorl of floral parts; in some rhododendrons reduced to a mere rim
CAMPANULATE see figs G and K
CAPITATE forming a dense head-like structure
CILIATE fringed with hairs
CLONE two or more genetically identical individuals originally derived from one plant by asexual propagation
CORDATE with two rounded lobes forming a deep sinus
CORIACEUS leathery
COROLLA the whorl of floral parts immediately inside the calyx; in rhododendron flowers usually fused to form a corolla tube towards the base with free lobes towards the apex
CRENULATE with small rounded teeth
CUNEATE with straight sides converging at the base
CUSPIDATE tapering to a short, narrow point
DENDROID of a hair that is branched like a tree
DETERSILE of a indumentum that is eventually completely shed
DIMORPHIC of scales or leaves that are of two distinct kinds
DORSAL in a rhododendron flower used to refer to the top or upper lobe or lobes
DOUBLE of flowers with numerous extra petals or petal-like organs within the corolla (often developed from and replacing the stamens and or pistil)
EGLANDULAR lacking glands
ELLIPTIC see fig. P
EYE sometimes used interchangeably with blotch but typically a contrasting marking restricted to the base of the corolla
FERRUGINOUS rusty brown
FILAMENT the stalk-like part of the stamen, bearing the anther at its apex
FIMBRIATE with a fringed margin
FLARE sometimes used interchangeably with blotch, but usually a marking with a flame-like outline.
FLOCCOSE with dense woolly hairs that fall away in tufts
FUNNEL-CAMPANULATE intermediate in shape between funnel-shaped and campanulate
FUNNEL-SHAPED see figs A and C
GLANDULAR HAIRS hairs bearing glands at their tips
GLAUCESCENT becoming bluish green
GLAUCOUS bluish green
HOSE-IN-HOSE of flowers with two corolla whorls, one within the other; a normal calyx may or not be present
IMBRICATE overlapping at the margins
INFLORESCENCE a flower cluster
INDUMENTUM the covering of hairs and/or scales; may range from very sparse to dense and multilayered
LAMINA the blade of the leaf
LANCEOLATE see fig. R
LEPIDOTE bearing scales
LINEAR see fig. Q
MATT with a dull surface
MUCRONATE terminating abruptly in a short, hard point (the point formed from the limb and vein/midrib)
NECTAR POUCHES see under nectary
NECTARY nectar-bearing areas on the corolla, sometimes in sac-like protuberances or pouches
OBLANCEOLATE see fig. N
OBLIQUE of a leaf base where the two margins reach the petiole asymmetrically
OBLONG see fig. L
OBOVATE see fig. O
OBTUSE rounded end which would not be contained within two lines set at 90°
ORBICULAR see fig. M
OVARY the basal part of the pistil, containing the ovules; it matures to form the capsule containing the seeds
OVATE see fig. S
PEDICEL the stalk of an individual flower
PETALOID petal-like
PETIOLE the stalk of a leaf
PILOSE with long soft hairs
PISTIL the female reproductive organ, consisting of the ovary at the base, which is prolonged apically into the style that is tipped by the stigma
PLASTERED an indumentum with the components stuck together to form an apparently continuous sheet (sometimes described as agglutinated)



Figs A to K: Flower shapes
A = funnel-shaped
B = tubular funnel-shaped
C = broadly funnel-shaped
D = tubular
E = tubular-campanulate
F = saucer-shaped
G = campanulate
H = ventricose-campanulate
I = trumpet-shaped
J = rotate
K = broadly campanulate



Figs L to S: Leaf shapes

L = oblong
M = orbicular
N = oblanceolate
O = obovate
P = elliptic
Q = linear
R = lanceolate
S = ovate

PUBERULOUS minutely hairy
PUBESCENT with short hairs
RACEMOSE of an inflorescence whose growing point continues to add to the inflorescence, usually lacking a terminal flower and with a lengthened axis
RETICULATE marked with a network of veins
RETUSE with a shallow, blunt notch at the apex
REVOLUTE rolled downwards
RHACHIS the axis of the inflorescence
ROTATE see fig. J
RUFESCENT becoming reddish
RUGOSE with a wrinkled surface
SALVERFORM a corolla with a long narrow tube and a shorter spreading border at its mouth
SAUCER-SHAPED see fig. F
SELF refers to a corolla of only one colour
SEMI-DOUBLE of flowers with a few extra petals or petal-like organs within the corolla
SESSILE with no stalk
SETOSE of an indumentum consisting of stiff hairs
SINGLE of flowers without additional petals or petal-like organs within the corolla
SINUS the depression between two lobes or teeth
SPATHULATE paddle-shaped
STAMEN the male reproductive organ, consisting of a stalk-like filament bearing the pollen-bearing anther
STELLATE star-shaped
STIGMA the apical part of the style which is receptive to pollen
STOLONIFEROUS with (at least some) procumbent stems
STRIGOSE of an indumentum consisting of stiff, appressed hairs
STYLE the usually attenuated, often stalk-like beak to the ovary, with the stigma at its apex
TOMENTOSE with a dense covering of short often more-or-less matted hairs
TRUMPET-SHAPED see fig. I
TRUNCATE terminating very abruptly, as if a piece had been cut off
TRUSS a cluster of flowers
TUBULAR see fig. D
TUBULAR-CAMPANULATE see fig. E
TUBULAR FUNNEL-SHAPED see fig. B
UMBELLATE an inflorescence in which all the pedicels arise from the top of the stem
VENTRAL in a rhododendron flower used to refer to the bottom or lower lobe or lobes
VENTRICOSE swollen or inflated on one side
VENTRICOSE-CAMPANULATE see fig. H
VILLOUS shaggy
VISCID sticky
ZYGOMORPHIC having only one plane of symmetry

(a) **'Admiraal de Ruiter'** (Syn. of 'Admiraal de Ruyter')

(a) **'Admiraal de Ruyter'** cv. Deciduous azalea: parentage unknown I: L.van Houtte (1849), INC: ICRA (1958) Fls deep blood red, slightly spotted orange (L. van Houtte, 1871). This description was used quite widely in the second half of the 19th century by van Houtte and others. The name was first substituted for 'Cardinal' in van Houtte's 1849 list where the description (deep rose, edged more red and with a yellow blotch) indeed equates with the earlier description for 'Cardinal' (cf. D. Spae, 1846): this earlier use is treated as a synonym of 'Cardinal'. It seems likely, however, that van Houtte had two plants under the name 'Admiraal de Ruyter' and the apparent later use is recorded here. Syn: 'Admiraal Ruyter', 'Admiral de Ruyter', 'Amiral Ruyter', 'Admiral de Ruiter'
